Problem G: Simply Emirp

An integer greater than 1 is called a prime number if its only positive divisors (factors) are 1 and itself. Prime numbers have been studied over the years by a lot of mathematicians. Applications of prime numbers arise in Cryptography and Coding Theory among others.

Have you tried reversing a prime ? For most primes, you get a composite (43 becomes 34). *An Emirp (Prime spelt backwards) is a Prime that gives you a different Prime when its digits are reversed.* For example, 17 is *Emirp* because 17 as well as 71 are Prime. In this problem, you have to decide whether a number **N** is Non-prime or Prime or *Emirp*. Assume that **1**< **N**< **1000000**.

Interestingly, Emirps are not new to NTU students. We have been boarding 199 and 179 buses for quite a long time!

Input

Input consists of several lines specifying values for **N**.

Output

For each **N** given in the input, output should contain one of the following:

1. "**N** is not prime.", if **N** is not a Prime number.
2. "**N** is prime.", if **N** is Prime and **N** is not *Emirp*.
3. "**N** is emirp.", if **N** is *Emirp*.

Sample Input

```
17
18
19
179
199
```

Sample Output

```
17 is emirp.
18 is not prime.
19 is prime.
179 is emirp.
199 is emirp.
```
